Code Review 6

Good morning students,

Welcome to your 6th CodeReview. Time to show off with Angular!

You will need to achieve more than 60 points to pass this CodeReview successfully.

You will be graded accordingly to the results achieved. Please see the number of points for each task below.

The grading system has the following rules:

Up to 60 points = red

Between 61 and 79 = yellow

Over 80 = green

You can submit your solution (as GitHub project link) until **Saturday 18:00:00**.

Task description

Benvenuto al Ristorante Il Gambero Rosso. In this CodeReview, you have to create a Delivery page for the best Restaurant in Padova Province, in the North of Italy, using Angular obviously.

GUI guideline: You are allowed to use CSS and/or bootstrap.

In order to accomplish this project, you will need to create **at least 7 pages/components**: NavBar, Home, Footer, About Us, Menu, Details and Order(Cart) (you are free to create additional components if you have time and inspiration). The **NavBar** will be always showing no matter what component is triggered, the same for the **Footer**. **Home** and **About Us** should have static content. **Menu** will hold dynamic content created from objects. On clicking on the Details button it should lead to the details page which will bring specific information from that dish.

Please examine the designs below as a suggestion:

Home and About Us components will have static content and can have a similar design to the example below. Feel free to provide your content for those pages instead of LoremIpsumDolor 😊 :

Ristorante Il Gambero Rosso

The Menu component will hold the dynamic content and should present at least 6 dishes with their image, small description and price.

Submission Guidelines:

Submission guideline note: Standard submission procedure should be used, which includes: Creation of a GitHub project (repository name FE15-CR6-Name), "push" to the repository and provide the information to CodeFactory through the learning management system (<https://lms.codefactory.live/>) with the GitHub link for the cloning procedure.

For this CodeReview, the following criteria will be graded:

- **(05 points)** Create a GitHub Repository named: FE15-CR6-Name.
- Push the files into it and send the link through the learning management system (lms). Add codefactorygit as a collaborator and assure your repository is set to private. See an example of a GitHub link below:

<https://github.com/JohnDoe/repositoryname.git>

- **(10 points)** The final result of your theme design must be responsive by using css or Bootstrap.
- **(15 points)** Your project must contain at least 7 components that together will build up your application as follows: NavBar, Home, Footer, About Us, Menu, Details and Order(Cart)
- **(15 points)** Use routing to move between the pages without refreshing the browser (SPA). The navbar contains the navigation links that allow you to go through the components and go back to the home page.
- **(15 points)** Each dish(object) must have at least the following properties: name, image, description, price and availability (Boolean).
- **(10 points)** If the availability of the dish is true, the buttons "Details" and "Order" must be shown in each dish. If it is false, it shouldn't show the buttons for that object, only the dish picture with a message "Not available", instead.
- **(20 points)** Create the functionality that when you click on Order button, the dish will be added to the cart. The user must be able to order as well from the Menu component or from the Details component. The Order component must show the content of the cart.
- **(10 points)** A details component must be created. It will hold specific information about the dish when clicked on the button Details. The user must be able to order from this component.

Bonus Points:

- **(10 points)** Display the total of the Bill with a "Service" section that shows 10% of the total amount.
- **(10 points)** If the Total sum is more than EUR 40, the user gets a 15% discount. The total without discount and the new price with the discount must be neatly shown on the screen.

Feedback comments

Hi Joshua, you have achieved a good result on the design of ur Restaurant app. It is responsive and it looks very similar to the example given. The cart functionality although it works, has a little flaw: the object isent passed over to the function. Please note that at the menu component u dont need the object id from the url, only in the details component. The function in the loop needs the object in it, in ur case, "dish" and the same function in menu.ts needs to accept a parameter. The details component is working fine when u fix that. Let me know if u would like to take ur chance and improve ur grade. U have 24hrs from this time on. Well done
